---

---

---

---

---

## My Research Group

- **Mission**

- Understand what makes it hard to manage data
- Create tools to fix the problems we understand
- Watch people use them to understand more

- **Technical Areas:**

- Databases
- Information Retrieval
- Machine Learning
- Semantic Web
- Human Computer Interaction

- **Theme**

- Empower end users to manage on their own

---

---

---

---

---

---

## Why User Interfaces?

The ability to take data—to be able to **understand** it, to process it, to extract value from it, to **visualize** it, to **communicate** it—that's going to be a hugely important skill in the next decades, ... because now we really do have essentially free and ubiquitous data. So the complimentary scarce factor is the ability to understand that data and extract value from it.

**Hal Varian, Google's Chief Economist  
The McKinsey Quarterly, Jan 2009**

---

---

---

---

---

---

---

---

---

## Why User Interfaces?

- Computers can store and process information at super-human scale
- But people are still superior to computers in many information processing activities
  - See patterns
  - Notice oddities
  - Impose order
  - Choose a suitable model
- Combination is more powerful than either
- Even if computer does most of the work, need a way for human to tell it what work to do

Tackling the Challenges of Big Data

---

---

---

---

---

---

---

---

---

## The Value of Interfaces

- **Analyze data to support reasoning**

- Expand memory
- Find patterns
- Develop and assess hypotheses
- Discover errors in data

- **Communicate information to others**

- "Seeing is Believing", "Picture worth 1000 words"
- Share and persuade
- Collaborate and revise

## User Interfaces for Data

- User Interface Design is a huge subfield of HCI**
- Focus here on UI for data**
  - large number of items
  - all following same schema
  - e.g., table of rows (items) with columns (schema)
  - or many items of a few types, where each type has a common set of properties
- Data UIs exploit the regularity of the data**
  - spreadsheet shows each property in a column
  - scatter plot maps one property on each axis
  - web site uses 1 template for all items of same type
  - and facets to filter on a particular property

## Why Visualizations?

- **"A picture is worth a thousand words"**
- **We receive information through our senses**
- **Far higher bandwidth than thought**
  - React to an image much faster than thinking
  - Perceive and remember details without thinking
- **Transform abstract data to visual variables**
- **Leverage pre-attentive processing**
  - Information we process without thinking

## Elementary Abstract Data Types

- **Nominal (qualitative)**
  - (no inherent order)
  - city names, types of diseases, ...
- **Ordinal (qualitative)**
  - (ordered, but not at measurable intervals)
  - cold, warm, hot; historical eras ...
- **Quantitative**
  - Numeric
  - Some absolute (fixed 0): mass, length
  - Some relative (arbitrary 0): date, position
- **Relational**
  - Connections between items
  - Social network, subway map

## Lying Eyes

- Lies, damn lies, statistics, and visualizations.
- One's convincing visualization is another's propaganda
- Visualization can fail to reflect correct values
- Worse, eyes can deceive even when the numbers are "right"

## Volume encoding?

---

---

---

---

---

---

---

---

---

---

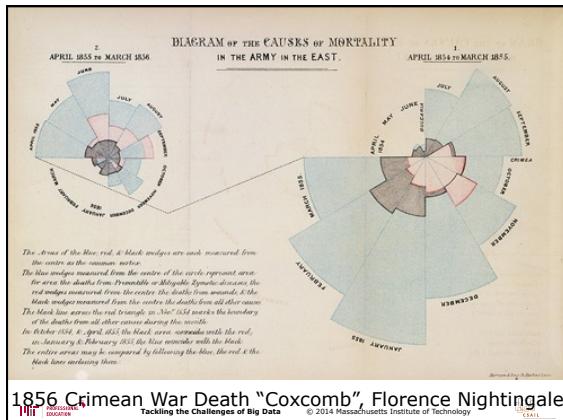

---

---

---

---

---

---

---

---

---

---

---

---

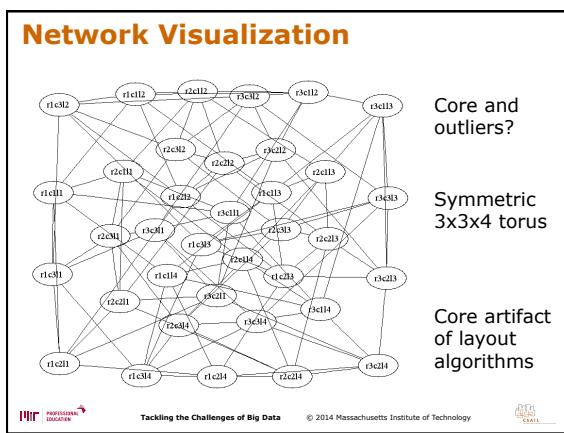

---

---

---

---

---

---

- ## How not to lie
- Show entire scale
  - Show data in context
  - Consistent, linear scale
    - Log scale for log data
  - Use visual variables appropriate to data
    - Don't falsely imply ordinal/quantitative relationships
  - Avoid size encoding
    - Use height OR width
    - Don't use both for same data attribute
    - Avoid area, volume encoding
-  Tackling the Challenges of Big Data © 2014 Massachusetts Institute of Technology 

---

---

---

---

---

## Tufte: Graphical Integrity

- Lie factor =  $\frac{\text{size of effect in graph}}{\text{size of effect in data}}$
- The representation of numbers, as physically measured on the surface of the graph itself, should be directly proportional to the numerical quantities represented
- Clear, detailed and thorough labeling should be used to defeat graphical distortion and ambiguity. Write out explanations of the data on the graph itself. Label important events in the data.

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

## Tufte: Graphical Integrity

- Show data variation, not design variation
  - i.e., don't add decoration just for looks
- In time-series displays of money, deflated and standardized units of monetary measurement are nearly always better than nominal units
- The number of information carrying (variable) dimensions depicted should not exceed the number of dimensions in the data
- Graphics must not quote data out of context

---

---

---

---

## Summary

- **Visualizations are powerful communicators**
- **Use that power wisely**
  - Ask what your visualizations imply that isn't true
  - Show entire scale
  - Show data in context
  - Use appropriate visual variables (nominal vs. quant.)
- **Leave art to the artists**
- **Be skeptical of visualizations you see**

 Tackling the Challenges of Big Data © 2014 Massachusetts Institute of Technology 

---

---

---

---

---

---

## Interactivity

- **A visualization can raise questions**
  - Is this true or an artifact of the visualization?
  - Why....
  - What if....
- **If it's static, they're hard to answer**
- **Interactivity can help**
  - Look at data from multiple perspectives
  - Change data, see what happens to visualization
  - Test hypotheses
- **Better for analysis: more informative**
- **Better for communication: more convincing**

---

---

---

---

---

---

---

---

## Why?

- **Interaction lets you navigate a huge space of possible visualizations until you find the one that tells you what you want to know**

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

## Plan

- **Mindset: Exploratory Data Analysis**
  - Roots of data interaction interfaces
- **Interface tactic: Direct Manipulation**
  - The right input mechanism for most users
- **Interface strategy:**
  - Overview first
  - Zoom and filter
  - Details on demand

## Exploratory vs. Confirmatory

- Confirmatory data analysis tests a hypothesis**
  - E.g., whether data fits a certain distribution
- But how do you develop the hypothesis?**
  - Need to explore
- Visualizations wrong for confirmatory analysis**
  - Too easy to deceive
- But great for suggesting hypotheses to test**
  - Make sure to confirm in other ways

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

## John Tukey

**"If we need a short suggestion of what exploratory data analysis is, I would suggest that**

- it is an attitude AND
- a flexibility AND
- some graph paper (or transparencies, or both).

**No catalogue of techniques can convey a willingness to look for what can be seen, whether or not anticipated. Yet this is at the heart of exploratory data analysis. The graph paper - and transparencies - are there, not as a technique, but rather as recognition that the picture-examining eye is the best finder we have of the wholly unanticipated."**

---

## Summary

- Exploratory data analysis
  - looking at data without preconceptions
  - distinct from confirmatory analysis
- Benefits from trying different visualizations
  - Computer provides great support
- Remember visualizations can deceive
  - Need non-visual confirmatory tools
- Next: what kind of interfaces help explore?

---

---

---

---

---

---

## Goal

- Want interfaces that permit user to explore
- Ideally, think about the data without thinking about the interface
- Information visualization user pre-attentive visual features to understand without thinking
- What is the analogue for interacting with the data?

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

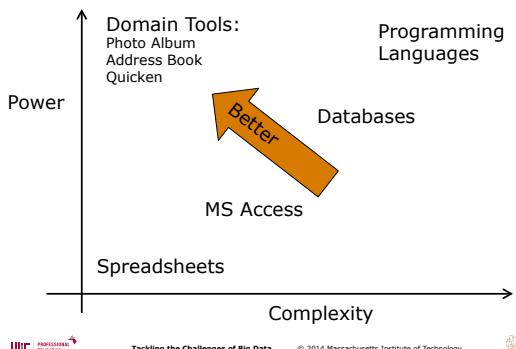

---

---

## Spectrum of Interface Capabilities

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

---

## Direct Manipulation Motivation

### Advanced Users

- Think abstractly
- Have a language of relevant actions
- Can describe a sequence of actions (program syntax)
- Can debug, try again
- Read the manual

### Amateurs/Novices

- Think concretely
- Know what they want done, but not what to call it
- Can show, not tell
- Don't know what they did wrong
- Learn by doing

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

---

## Direct Manipulation Examples

### Advanced Users

- DOS command line
- Hotkey shortcuts
- HTML/LaTeX/WikiText source code
- Write programs
- Write SQL database queries
- Zork, Adventure

### Amateurs/Novices

- Desktop files & folders
- Menus
- WYSIWYG editors
- Record macros
- Excel & (some) Access
- Pong, Space Invaders

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

## Direct Manipulation Paradigm

- Continuous representation of the objects and actions of interest
- Physical actions or button presses instead of complex syntax
- Rapid incremental reversible operations whose effect on objects is immediately visible

Shneiderman, Ben (1983). Direct Manipulation: A Step Beyond Programming Languages

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

## Direct Manipulation Motivation

### Advanced Users

- Think abstractly
- Have a language of relevant actions
- Can describe a sequence of actions (program syntax)
- Can debug, try again
- Read the manual

### Amateurs/Novices

- Think concretely
- Know what they want done, but not what to call it
- Can show, not tell
- Don't know what they did wrong
- Learn by doing

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

## Direct Manipulation Utility

### DM interfaces

- Show data to explore
- Shows available actions
- Immediate feedback
- Physical interactions directly manipulate data
- Reversible
- Discoverable actions

### Amateurs/Novices

- Think concretely
- Know what they want done, but not what to call it
- Can show, not tell
- Don't know what they did wrong
- Learn by doing

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

## Direct Manipulation Tradeoff

- Programming language/command line is usually more powerful
- Direct manipulation is easier to learn and use
- Even experienced users prefer direct manipulation when they can get it
- But resort to programming when the DM tools aren't powerful enough

Tackling the Challenges of Big Data

---

---

---

---

---

---

---

---

**Example: The “Web” in 1987**

```

graph TD
    A[Connect to site] --> B[Fetch content]
    B --> C>Show content
  
```

Photos removed due to copyright restrictions.  
We are sorry for any inconvenience this may cause.

MIT PROFESSIONAL EDUCATION  
Tackling the Challenges of Big Data © 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

**Example: “The Web” in 1987**

- How did the web change things?
- No typing connect/fetch commands
- Instead, click on what you want
  - Show, don’t tell
- The web didn’t make anything new possible
- It just made something simple much simpler via direct manipulation

MIT PROFESSIONAL EDUCATION

## Filmfinder: Interactive Scatterplots

Photos removed due to copyright restrictions.  
We are sorry for any inconvenience this may cause.

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

---

## Interface Choices

- **Scatter plot**
  - two quantitative feature axes: year and popularity
  - hues for (nominal, unordered) movie types
- **Direct manipulation**
  - Buttons for (nominal) categories
  - Sliders for (alphabetically ordered) names
  - Range slider for (quantitative) length
  - Zoom in to smaller date range
  - All actions immediately reversible
- **Initial view gives complete overview**
- **Selecting specific subsets shows subset of scatter points, preserving context**

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

---

## Pre-attentive Interaction

- Goal of information visualization was output via pre-attentive features
  - User acquires information by sight, without thought
- Goal of direct manipulation is input via “pre-attentive” features
  - User must make a decision to do something
  - But doesn’t want to think about how to do it
  - (video games truly pre-attentive)
  - perhaps data interfaces someday as well)
- Direct manipulation tools for data is as important as the desktop and WYSIWYG editors were

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

---

## Data Linking and Brushing

- Direct manipulation technique for filtering
- **Link:**
  - Associate two or more visualizations of same data
- **Brush:**
  - Select a subset of data points
  - See role played by subset of points in linked views
- Redoes visualization (output) as filter (input)
- Example systems
  - Datadesk
  - Graham Wills’ EDV system
  - Ahlberg & Shneiderman’s IVEE (Spotfire)

---

---

---

---

---

---

---

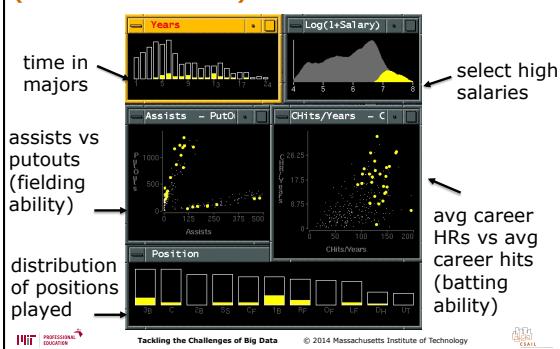

---

---

## What was learned from interaction

- Seems impossible to earn a high salary in the first three years
- High salaried players have a bimodal distribution (peaking around 7 & 13 yrs)
- Hits/Year a better indicator of salary than HR/Year
- High paid outlier with low HR and medium hits/year. Reason: person is player-coach
- There seem to be two differentiated groups in the put-outs/assists category (but not correlated with salary) Why?

Tackling the Challenges of Big Data

Massachusetts Institute of Technology

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

## Interaction Strategy

- [Schneiderman '96]
- Overview first
  - Give user a starting point
- Filter
  - Ways to restrict to interesting sets of points
- Pan & Zoom
  - Let them hone in on an interesting area
  - Get more detail about that area
- Details on demand
  - Extreme zoom
  - See everything about one or a few items

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

## Interaction Strategy

- **Overview**

- Don't start user with a blank screen
- Give them an idea of what the data is and what they can do
- The first impression---what should it be?

- **Filter**

- Saw buttons to filter on type
- Sliders to choose ranges of values
- Linking and brushing

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

## Pan & Zoom

- **Direct manipulation filtering**

- **Spatial metaphor**

- Movement is pre-attentive?

- **Apply to features that have been mapped to spatial coordinates (positions)**

- **Shift in spatial coordinates defines shift in parameters**

- **Animation (smooth motion) helps preserve context as data points move**

- **Obvious application: spatial data (maps)**

- **But also applies to more abstract features**

## Tackling the Challenges of Big Data

### Big Data Systems

### User Interfaces for Data

### Data Interfaces on the Web

**David Karger**

Professor

Massachusetts Institute of Technology

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

---

## Overview

- Many web sites are fronts for large data sets
- Common paradigm has emerged for presenting them
  - Useful, because users know what to do
  - Matches Schneiderman's workflow
- Views
  - Overview of all items
- Faceted browsing
  - Direct-manipulation filtering
- Templates
  - Uniform presentation of individual item details

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

---

## Views

- Aggregate overview of all items
- Sortable list, map, table, grid...

Photos removed due to copyright restrictions.  
We are sorry for any inconvenience this may cause.

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

---

## Templates

- Detail view on individual items
- In list or grid, may show for each item
- Popup on demand for maps, grids

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

---

## Templates

- Uniform presentation of all items
- Easier for us to parse
  - Quickly get used to which attribute goes where
  - Leverages power of (pre-attentive) position
- Pleasant user experience
  - Could show same info in a table, but that's ugly
- Usually generated by templating engine
  - Easy maintenance: just change the template

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

---

## Faceted Browsing

- Direct manipulation filtering
- Check-off values to filter

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

---

---

---

---

---

---

---

---

---

Photos removed due to copyright restrictions.  
We are sorry for any inconvenience this may cause.

 Tackling the Challenges of Big Data © 2014 Massachusetts Institute of Technology 

---

---

---

---

---

---

---

---

## Faceted Browsing

- Dominant filtering paradigm
- Give users a list of values for each attribute
- They pick some
- Collection restricts to items matching those values

 Tackling the Challenges of Big Data © 2014 Massachusetts Institute of Technology 

---

---

---

---

---

---

---

---

## vs. Hierarchical Browsing

- Original Yahoo site
- Navigate a hierarchy
- Links to children
- Forces user to descend hierarchy in order you defined
- Filters that don't match hierarchy unavailable
- Supports "zoom", but not filter

 Tackling the Challenges of Big Data © 2014 Massachusetts Institute of Technology 

---

---

---

---

---

---

---

---

## Facet Benefits

- **Direct manipulation**

- Shows user what filtering options are available
- User selects by click, unselects by another
- Immediate undo if dislike outcome

- **Independent attributes**

- Unlike hierarchy, user can mix filters arbitrarily

- **Apply in any order**

- Result is intersection of all facet constraints
- Final result independent of order of application

Tackling the Challenges of Big Data

Enumerated List (CNET)

Matrix (Orbitz)

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

## Common Practices

- **Hide values yielding no results**

- Avoids frustrating dead ends
- Update as other facets are applied

- **Even better, show count of matching results**

- Lets user see what will happen if they select
- Using numbers (in a list of values)
- Or size (in a tag cloud)

- **Breadcrumbs**

- Show user a trail of user selections
- They can back up
- Or easily remove specific constraints

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

## Views+Facets+Templates

- Users know what to expect
- So they know how to interact with new sites
- Are all data web sites done this way?

## Summary

- Most web data sites share common paradigm
- Standard workflow: overview, filter, details
- Collection **overview** (list, map, grid)
- Facets for **filtering**
- Templates show item **details** uniformly

Tackling the Challenges of Big Data

---

---

---

---

## Impoverished Data Visualization?

- Is sameness of all these sites a good thing?
- Most information presenters are not ambitious
- Carefully designed, domain- and task-specific information interactions will always be superior
- But powerful lowest common denominator
- People's experience of it makes it more powerful
  - Leverage expectations
  - No need to learn new site

---

---

---

---

---

---

---

---

## Building the Data Web

- **Data-backed web sites created by professionals**
  - Back-end database engineers
  - Front-end designers
- **Regular users can't do the same**
  - They author static text pages
  - Or put data on sites others built
- **What if you want to present your data your way?**
  - E.g., create a combined presentation of photos and recipes organized by food in the pictures?

---

---

## Idea

- **They're all the same**
  - So is programming really needed?
- **Extend HTML to describe standard elements**
  - Templates, Views, Facets
  - Each refers to specific data fields (columns)
- **Now creating a data visualization is just HTML authoring**
  - Edit the source code
  - Or copy and modify someone else's
  - Or use a WYSIWYG editor
- **Anyone can create their own visualizations**

## Prototype: Exhibit

- **Specific data/viz HTML vocabulary extension**
  - And a Javascript library to interpret it
- **Application independent**
  - Fits any tool that takes HTML, e.g. HTML editor
- **Pure client side**
  - No need to design/admin server
- **Freely interleave data with other HTML**
  - Complete control of design
  - Integration with whatever other elements you like
- **Author one HTML page, get interactive data visualization**

## Summary

- Sameness of data web sites is an opportunity for simplification
- Instead of programming a site, standardize around basic elements
  - Views, templates, facets
- Any user can create their own visualization
  - WYSIWYG html authoring
- Permits more effective communication

## Haystack

- **Semantic Web app before the Semantic Web**
  - Research paid for by the machines I didn't buy
- **Entity-relation data model**
- **"Lenses" to display individual items**
  - Specification of which properties, and their layout
- **"Views" of collections**
  - E.g. lists, thumbnails, tabular
- **"Facets" to filter items**
- **When RDF invented, became Haystack model**
  - And haystack became an early "semantic desktop"

## Databases

- **The dominant paradigm for data management**
- **Operate on tables**
  - Columns are attributes of interest
  - One row per "item"
    - Person: Name, Age, Employer
    - Company: Name, Sector, Earnings
- **Basic operations**
  - Select some rows by filtering value in columns
    - All rows where age=43
  - Join multiple tables
    - Find employees of companies earning more than \$1M
- **SQL is the dominant programming language**

---

---

---

---

---

## Spreadsheets

- **Dominant database tool for end users**
  - Direct manipulation of rows
  - Study found most spreadsheets have no formulas!
- **But limited**
  - Only one table in view at a time
  - No joins
  - Hard to represent connections between tables
  - No support for many-many relationships
- **Goal: add power but preserve look and feel**
  - Nested views
  - Linkage/navigation between multiple tables

## One-to-Many and Many-to-Many Relationships

Tackling the Challenges of Big Data

© 2014 Massachusetts Institute of Technology

## Spreadsheet Solutions

### • Multiple worksheets

- One per table
- Effective to hold data
- But forces painful navigation
- Little support for moving between tables

### • Comma-separated lists

- Offer only one level of multiplicity
- If each of multiple items has multiple other items, trouble

CLOUD COMPUTING

## User Study

### # | Description

- Find a course that is taught by Harry Morrell.
- In the course "MUS 105: Music Theory Through Performance and Composition," what percentage of the final grade is derived from the Midterm Exam?
- Find a course that satisfies the "LA" (Literature and the Arts) distribution area, with a lecture (meetings belonging to a section denoted "L01") that starts after noon (after 12:00).
- What is the e-mail address of the instructor who teaches "KOR 107: Intermediate Korean II"?
- Who teaches the precept section of "HIS 383: The United States Since 1920" that meets on Wednesdays at 10am?

---

---

---

---

---

---

## Conclusion

- Spreadsheets are the dominant database tool
- But sacrifice key capabilities
  - Multiple tables
  - Multiple values
  - Joins
- Enhance spreadsheet paradigm with
  - Multi-valued cells
  - Nested views of connected information
  - Teleportation to related worksheet cells
- User Study shows improvements over Excel
  - Faster
  - Fewer errors
